EX 9.

EX 10.

EX 11.

Definition. Let a be a positive constant. The function

$$f(t - a)H(t - a) = \begin{cases} 0 & t < a \\ f(t - a) & t \geq a \end{cases}$$

is called the **shifting** of $f(t)$ by a .

EX. $(t - 1)^2 H(t - 1)$

$$e^{t-3} H(t - 3)$$

$$\sin(2t - 2\pi) H(t - \pi) = \sin(2(t - \pi)) H(t - \pi)$$

Shift in t

Prop 5: t -shifting

EX 1.

EX 2.

EX 3.

EX 4.

Impulse and Dirac

EX 5.

EX 6.

EX 7.

Q 1.

Q 2.

Convol.

EX 8.

Thm. Conv

EX 9.

EX 10.

EX 11.

Theorem. Let $F(s) = \mathcal{L}[f(t)]$ and a a positive constant. Then

$$\mathcal{L}[f(t - a)H(t - a)] = e^{-as} F(s).$$

Thus

$$\mathcal{L}^{-1}[e^{-as} F(s)] = f(t - a)H(t - a).$$

Proof. By definition,

$$\begin{aligned}\mathcal{L}[f(t - a)H(t - a)] &= \int_0^{\infty} e^{-st} f(t - a)H(t - a) dt \\ &= \int_a^{\infty} e^{-st} f(t - a) dt.\end{aligned}$$

Shift in t

EX 1.

EX 2.

EX 3.

EX 4.

Impulse and Dirac delta

Laplace $\delta(t - a)$

EX 5.

EX 6.

EX 7.

Q 1.

Q 2.

Convol.

EX 8.

Thm. Conv

EX 9.

EX 10.

EX 11.

Use the change of variable $x = t - a$, the integral becomes

$$\int_a^{\infty} e^{-st} f(t - a) dt = \int_0^{\infty} e^{-s(x+a)} f(x) dx = e^{-sa} F(s).$$

So

$$\mathcal{L}[f(t - a)H(t - a)] = e^{-as} F(s).$$

EX 11.

Theorem.

$$\mathcal{L}[f(t)H(t - a)] = e^{-as} \mathcal{L}[f(t + a)].$$

Proof. Let $g(t) = f(t + a)$. Then $g(t - a) = f(t)$ hence

$$f(t)H(t - a) = g(t - a)H(t - a).$$

By the previous theorem,

$$\mathcal{L}[f(t)H(t - a)] = \mathcal{L}[g(t - a)H(t - a)] = e^{-as}G(s)$$

Since $G(s) = \mathcal{L}[g(t)] = \mathcal{L}[f(t + a)]$, the desired identity is true.

Definition Let $a \geq 0$. The **unit impulse function at a** or **Dirac delta function at a** is

$$\delta(t - a) = \lim_{\varepsilon \rightarrow 0} \frac{1}{\varepsilon} [H(t - a) - H(t - a - \varepsilon)].$$

Note. It can be proved that the following identity holds

$$\int_0^{\infty} f(t) \delta(t - a) dt = f(a),$$

for any continuous function f .
