

Austronesian etyma and Proto-Tai Sesquisyllabicity

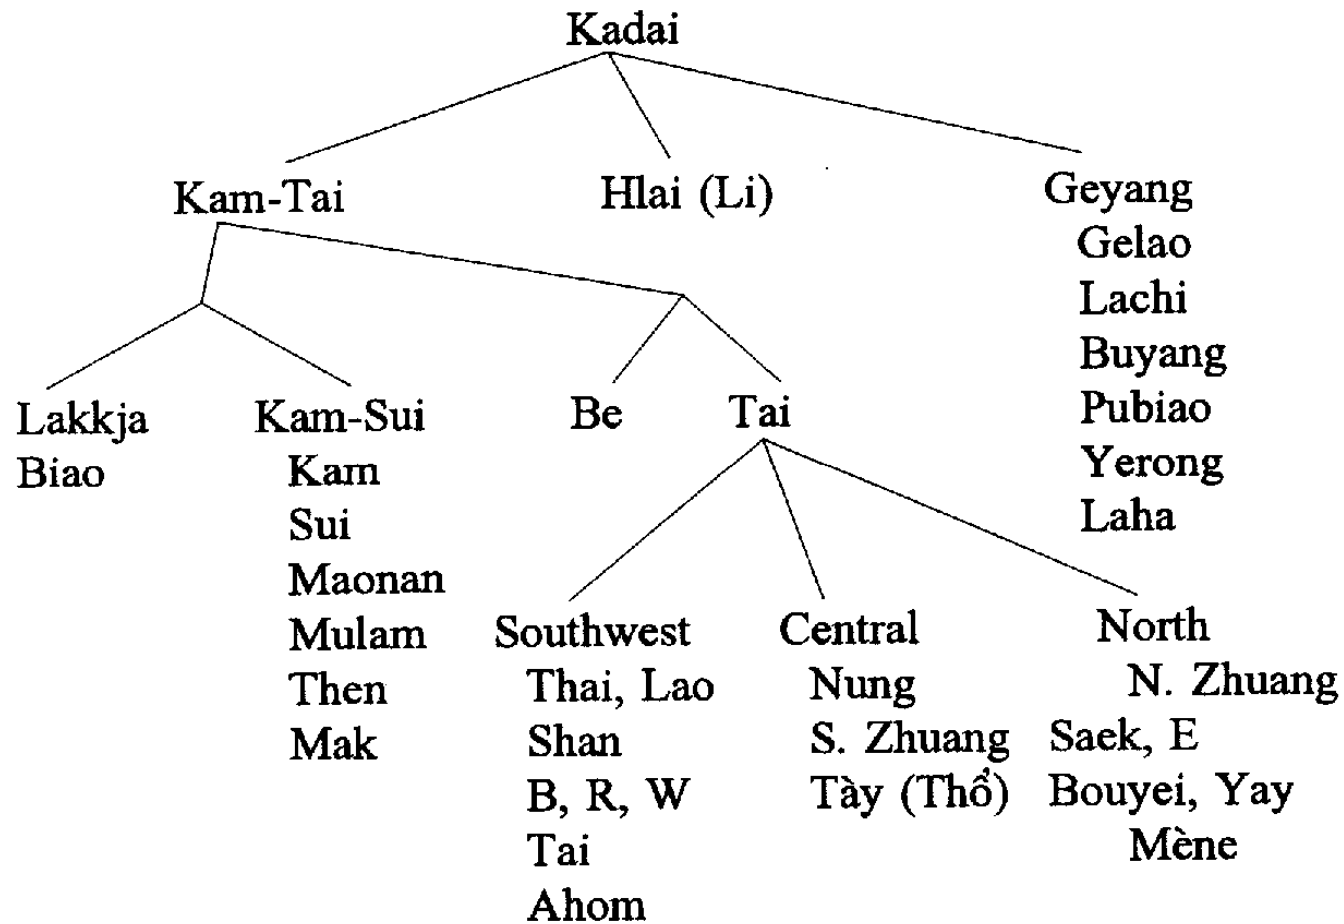

Pittayawat Pittayaporn
Cornell University

Tai languages

- Spoken in China, Vietnam, Laos, Thailand, Malaysia, Myanmar, India

Tai within Kra-Dai

[Austronesian and Tai]

- Tai belongs to Kra-Dai (= Tai-Kadai)
- Various researchers view Kra-Dai (KD) as related to Austronesian (AN), e.g. Schlegel (1902), Wulff (1942), Benedict (1942, 1975), Sagart (2004), and Ostapirat (2005)
- Benedict (1942, 1975) proposes that AN and KD form a phylum called “Austro-Thai.”
- Sagart (2004) proposes that KD is a subgroup of AN.

[After Austro-Thai]

- Benedict's work has been rightly criticized for its methodology and the quality of its evidence.
- Undeniable evidence (Benedict 1942, Sagart 2004, and Ostapirat 2005) for some kind of relationship.
- Lack of an adequate PT reconstruction

[Some AN-Tai vocabulary]

	Malay	Siamese
'eye'	mata	ta: ^{A1}
'die'	matay	ta:j ^{A1}
'bird'	manuk	nok ^{D2}

From Benedict (1942, 1975)

Some Tai-AN typological comparisons

	Tai	AN
prosodic word	monosyllabic	polysyllabic
onset	abundant clusters	no cluster
vocalism	complex	simple
tonality	tonal	non-tonal

[Issue and claim]

- How does the monosyllabicity of Tai languages relate to the polysyllabicity of AN?
- Different reconstructions of PT assume different canonical word-shape without explicitly addressing the issue.
- Following Ferlus (1990), PT was in fact NOT monosyllabic, but **sesquisyllabic**.

[Outline

- Sesquisyllabicity
- Conventional view
- PT as a sesquisyllabic language
- AN-related sesquisyllabic etyma in PT

[Sesquisyllables]

- **A sesquisyllable (1 ½ syllable)** is a prosodic word that consists of
 - an unstressed “minor” syllable (= ½ syllable)
 - a fully stressed “major” syllable (= 1 syllable)

(Matisoff 1973)

[Sesquisyllables (cont.)]

- The syllabicity of the minor syllable is carried by a neutral vowel or a syllabic consonant, i.e. **no phonological vowel in the first syllable.**
- Palaung (Shorto 1960)
 - /k.tɛ:/ ‘earth’ pronounced [k^(ə).tɛ:]
 - /kɾ.taʔ/ ‘tongue’ pronounced [k^(ə)r.taʔ]

Sesquisyllable vs. monosyllable

- A monosyllable is a word that clearly consists of one syllable.
- Palaung (Shorto 1960)
 - /taʔ/ 'to weave'
 - /kraʔ/ 'buffalo'

[Sesquisyllable vs. disyllable]

- A disyllable is a word that clearly consists of two syllables.
- Malay
 - /mata/ 'eye'
 - /tulan/ 'bone'
 - /pinang/ 'areca'

Sesquisyllabicity vs. monosyllabicity (cont.)

- Prosodic words in a monosyllabic language are **predominantly monosyllabic**.
- Tsat (Ouyang and Zheng 1983)
 - /pui³³/ ‘fire’
 - /p^hian¹¹/ ‘moon’
 - /ta¹¹/ ‘eye’

Sesquisyllabicity vs. monosyllabicity (cont.)

- Prosodic words in a sesquisyllabic language can be **either monosyllabic or sesquisyllabic**.
- Jarai (Lee 1966)
 - /pui/ ‘fire’
 - /blan/ ‘moon’
 - /m̩.ta/ ‘eye’ pronounced [m̩ta]

[The Chamic languages]

- Monosyllabic - Tsat
- Sesquisyllabic – Jarai
- Northern Roglai (Awoi-hathe et al. 1977)
 - /apui/ ‘fire’
 - /bila:t/ ‘moon’
 - /mata/ ‘eye’

[Diachronic model]

disyllabic

/mata/

sesquisyllabic

/m̩.ta/

monosyllabic

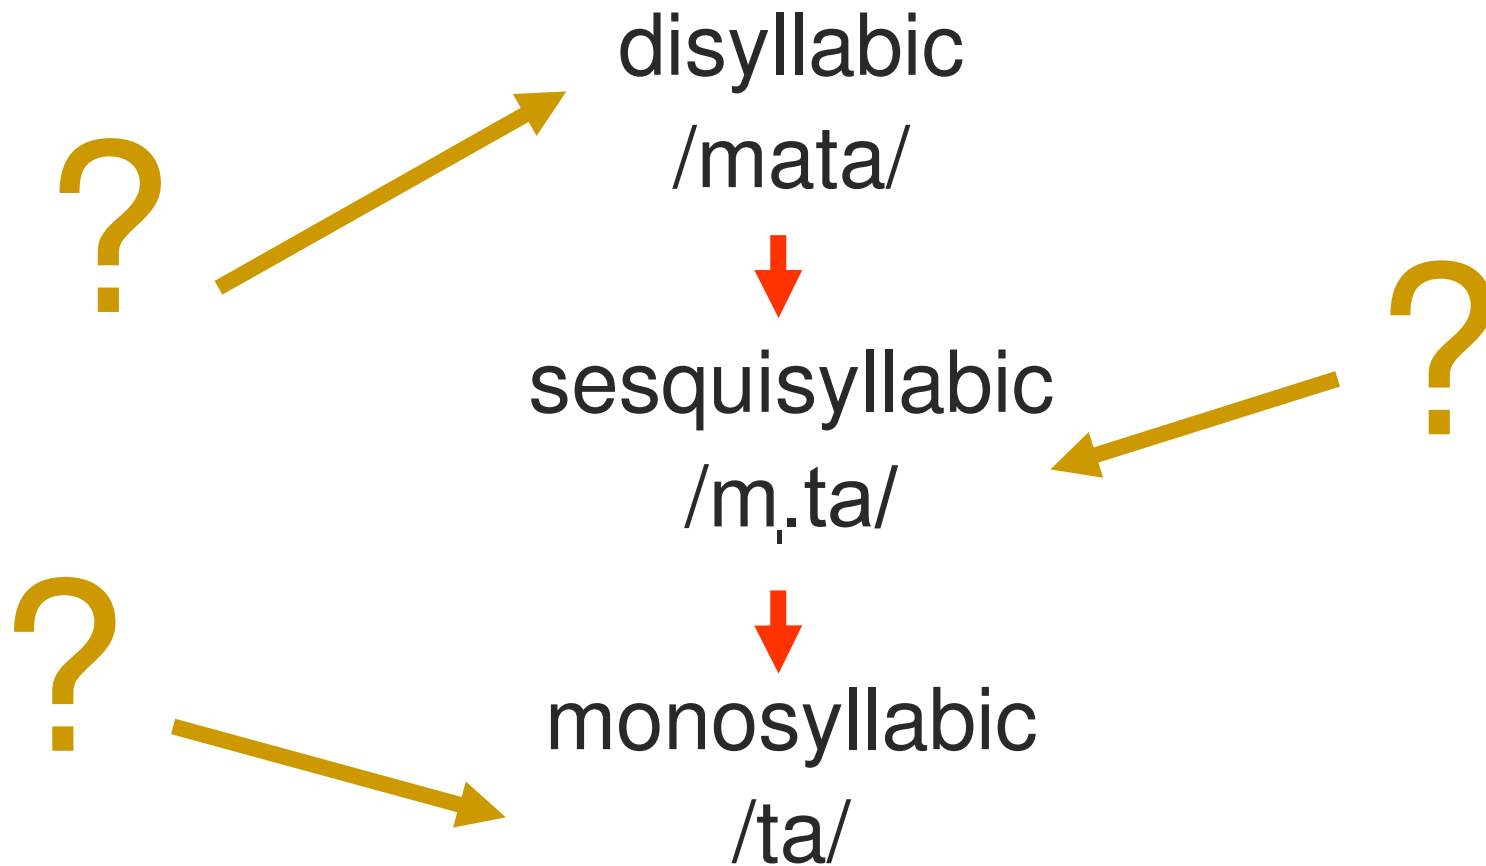

/ta/

Lee (1966), Thurgood (1999)

[What about PT?]

- Overwhelming evidence shows that native monosyllabic etyma in modern Tai languages must have developed from larger words, cf. Lakkja, Buyang etc.
- What was the state of affair at the PT stage?

[Diachronic model]

[The conventional view]

- Proto-Tai reconstruction by Li (1977)
- All PT prosodic words were strictly monosyllables.
 - *vɛj^A ‘fire’
 - *ʔblwən^A ‘moon’
 - *tra^A ‘eye’

[Problem]

- Many correspondences among Tai dialects unexplained, e.g.
 - *^ʔdr- is reflected as either /r-/ or /tr-/ in Saek
 - *tr- has labial reflexes /pr-/ or /p^hj-/ in some dialects

[Sesquisyllabicity of PT]

- PT was a sesquisyllabic language, cf. Ferlus (1990).
- A PT prosodic word was **either monosyllable or sesquisyllable**.
- Intermediate between Kra-Dai disyllabicity/polysyllabicity and modern Tai monosyllabicity.

PT as a sesquisyllabic language

- PT allowed both **monosyllabic** and **sesquisyllabic** prosodic words.
 - *blwən^A ‘moon’ (vs. Li’s *ʔblwən^A)
 - *wɣj^A ‘fire’ (vs. Li’s *vɛj^A)
 - *p.ta:^A ‘eye’ (vs. Li’s tra^A)
- Different branches became monosyllabic separately:
sesquisyllabic > monosyllabic.

[Proposal]

[Alternative: Disyllabic]

- Haudricourt (1975)
- Each PT prosodic word consisted of two syllables.
 - *mata^A ‘eye’ (vs. Li’s tra^A)
 - *apui^A ‘fire’ (vs. Li’s *vεj^A)
 - *bulan^A ‘moon’ (vs. Li’s *ʔblwən^A)
- Less likely because different branches must have gone through two evolutionary steps separately: disyllabic > sesquisyllabic > monosyllabic.

[To sum up...]

- The view that PT was sesquisyllabic best accounts for comparative data.
- There were both monosyllabic and sesquisyllabic etyma in PT.

[AN-related etyma in PT]

- Many sesquisyllabic etyma in PT clearly have AN correspondents.
- Basic vocabulary
- Loss of vowel of first syllable

[Body parts]

Gloss	PT	PAN (Blust)	PAN (Wolff)
'eye'	*p.ta: ^A	*maCa	*matá
'leg'	*p.qa: ^A	(*paqa)	*páqah
'shoulder'	*Ç.ba: ^C	*qabaRa	*qabáya

[Natural objects]

Gloss	PT	PAN (Blust)	PAN (Wolff)
'water'	*Ç.nam ^C	(*daNum)	*dáʈum
'moon'	*ᵛlʷən ^A	(*bulaN)	*bulaʈ

[Animals and plants]

Gloss	PT	PAN (Blust)	PAN (Wolff)
'bird'	*Ç.nok ^D	(*maNuk)	*maʦúk
'centipede'	*q.sep ^D	*qaluSipan	*qusalípañ
'rattan'	*Ç.wa:j ^A	*quay	*qúway

[Adjectives]

Gloss	PT	PAN (Blust)	PAN (Wolff)
'raw'	*Ç.dip ^D	*quDip	*qudip
'black'	*Ç.dam ^A	*tidem	*tidem

[Verbs]

Gloss	PT	PAN (Blust)	PAN (Wolff)
'to die'	*p.ta:j ^A	*maCay	*matáy
'to fart'	*k.tɣt ^D	*qetut	*qetut
'to weep'	*t.haj ^C	*tanjis	*tánjic
'to arrive'	*Ç.tɣŋ ^A	(*daten)	*daten

[Observations (1)]

- Onset correspondence is quite regular
 - PT *Ç.- corresponds to PAN vcl obstruents
 - PT *p.t- corresponds to PAN *mVt-
- But why PAN *q- corresponds to
 - PT *k in *k.tyt^D 'to fart'
 - PT *q in *p.qa:^A 'leg'

[Observation (2)]

- Vocalic transfer (Benedict 1977, Haudricourt 1975)
 - AN *bulaN > PT *ɓlɯən^A 'moon'
 - AN *tanjis > PT *t.haj^C 'to weep'
- Pre-Proto-Tai
- Pre-sesquisyllabic

[Observation (3)]

- Lower-level AN etyma
 - *blwəŋ^A ‘moon’ < *bulaN (vs. *qiNas)
 - *Ç.nok^D ‘bird’ < *maNok
 - *t.nam^A ‘to plant’ < *taNem (vs. *mula)
- How does this contribute to the question of genetic affiliation of KD?
- Does this support Sagart’s claim that KD is in fact a subgroup of AN?

[Conclusion]

- PT was a **sesquisyllabic** language that had both monosyllabic and sesquisyllabic etyma.
- Many sesquisyllabic etyma clearly show Austronesian connections and point to a very **close (genetic?) relation between AN and KD**.
